Concrete and material handling equipment

Secatol is constantly developing tailor made products for the pre-cast industry: models adapted to their needs and plant requirements. Secatol offers a high level of services to get essential information and feedback on possible improvements and therefore to be able to offer excellent products for the users and the environment.

Following these rules, they recently proposed the new TIC PF concrete skip: the new bale arm fitted into the bucket of the skip has been designed to improve the safety on the jobsite. The anti-turn-over plate and the clasp and coupling link fitted onto the lateral lifting eyes enables avoiding wrong handlings (pinching, crushing...). The auto-locking hose clip enables the hose to be folded when handling the skip. It avoids soiling the material and the construction above which the skip is moving.

The Betonet washing platform has been designed to retrieve and treat the sludge from the washing process. The water is recycled to be used for further high pressure washings or to be disposed of without pollution risks. A complete recycling circuit is made via 2 decanting trays, an oil filter and a PH treatment.

The new PP75 skip was designed to sort out and evacuate the waste on the jobsite or inside factories; its low width enables the skip to run through doors. Fitted with wheels, the skip can be handled everywhere. The system enables the operator to make handlings all by himself, without the help of a person on the ground.
